

1. Draw back the plunger to the 1cc mark (if using 0.5cc of Ethoss[®]TCP) or to the 2cc mark (if using 1cc of Ethoss[®]TCP). Do not remove the cover at this stage.

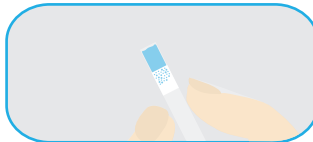

2. In order to loosen the powder and aid mixing, hold the syringe horizontally and tap the syringe until the Ethoss[®]TCP spreads out.

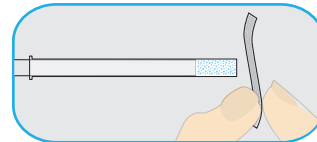

3. Return the syringe to the vertical position with the plunger at the bottom. Remove the end cover.

4. Fill with sterile saline (0.9% Sodium Chloride for injection) to the top of the syringe.

5. Tap the syringe for 10 seconds until the fluid has visibly soaked into the powder.

6. Place a sterile gauze over the end of the syringe and depress the plunger to expel any excess fluid. Your Ethoss[®]TCP is ready to use.
